Click **'OK'**. 5. **Wait for the connection to be established, the tunnel server will inform you.** 6. Run the application again. digger http tunnel Requirements: ----- 1. **Oracle® Solaris 7** 2. **Oracle® Solaris 8** 3. **Oracle® Solaris 9** 4. **Oracle® Solaris 10** digger http tunnel Changelog: ----- 10-05-2006: Added **proxy support** to the application. 10-05-2006: Added **proxy support** to the application. 02-27-2007: Added **support for Oracle® Solaris 10**. 06-18-2007: Added **new entry interface**. 08-16-2007: Added **support for Oracle® Solaris 8**. digger http tunnel Known Issues: ----- - There are no known issues with this tool. Notes: ----- This software is released under a non-commercial, open source licence. Please see the GNU General Public License for more information. If you have any problems with this software or with this license, please send e-mail to the author. Final stage of the

Digger Http tunnel Crack Download

Description: This is the main difference between http tunnel and its competitors. http tunnel uses a key derivation function (hash) to generate its MAC. The MAC is computed by appending the IP addresses of both end points and the generated key to it, after which it is written to the SSL negotiation. For more info on this technique, please read this wikipedia entry:

MISC_DESCRIPTION: http tunnel is a tool created to be a multipurpose HTTP tunnel that is able to run through any firewall or proxy. Digger Httpptunnel X64

httpptunnel is a tool created to be a multipurpose HTTP tunnel that is able to run through any firewall or proxy. It uses the CONNECT method but also the BOSH-like method, thus making it run on any proxy. It is useful for bypassing restrictive firewalls or proxies. Installation: `$ git clone $ cd httpptunnel $ pip install -r requirements.txt $ python httpptunnel.py $ sudo systemctl enable httpptunnel.service` How to use: - First configure your current system's proxy settings - `$ sudo systemctl enable httpptunnel.service` - Next, to start httpptunnel you can do: - `$ sudo systemctl start httpptunnel.service` - Next, you must add httpptunnel as a new route in your proxy configuration to make the "tunnel" work. In iptables, you can do this with: - `$ sudo iptables -t nat -I PREROUTING -p tcp --dport 80 -j REDIRECT --to-ports 8080` - Example output: - `$ sudo iptables -t nat -I PREROUTING -p tcp --dport 80 -j REDIRECT --to-ports 8080` - WARNING: Default options have been overridden by your system. The following command may not always work. In particular, please make sure to edit the following command to suit your needs. - `$ sudo iptables -t nat -I PREROUTING -p tcp --dport 80 -j REDIRECT --to-ports 8080` - To make httpptunnel continue to work, you have to add a new route like: - `$ sudo iptables -t nat -I PREROUTING -p tcp --dport 80 -j DNAT --to 127.0.0.1:8080` - Next, you should modify your proxy configuration to redirect the HTTP CONNECT request to httpptunnel. In iptables, you can do this with: -

What's New in the Digger Httpptunnel?

A tool to run HTTP and BOSH proxies through your firewall or network. It is especially good for running NGINX through a firewall to allow traffic to and from the internet. It is intended to be run as a server through the REST API. Requirements: The httpptunnel Python library is required to run. python is at least version 2.6. Installation: 1. Install the httpptunnel library. 2. Install Python. 3. Open the terminal and execute `sudo python setup.py install`. 4. Start httpptunnel as a server. `sudo python httpptunnel.py -d` Usage: 1. Create the http proxy server. `sudo python httpptunnel.py -b` 2. Connect to a specific port. `-b -p` 3. Start the server. `sudo python httpptunnel.py -d` 4. Bind a port to a specific interface. `sudo python httpptunnel.py -b -p -i` 5. Test the server. `curl -v` 6. Stop the server. `sudo python httpptunnel.py -d` 7. Browse the REST API. `curl -s -o /tmp/http.js`
