VOCALOID2 Megpoid. Welcome to VOCALOID2 Megpoid English for VOCALOID4 (voicebank) English VOCALOID2 Megpoid English by VOCALOID2 Megpoid. VOCALOID English voices, Megpoid English voicebank, Megpoid English1. Field of the Invention This invention relates to an improvement in or relating to a video signal receiving apparatus which receives, from an antenna, a video signal as an RF signal (which may be referred to as a video signal hereinafter). 2. Description of the Related Art In a video signal receiving apparatus, a video signal in a specific channel is ordinarily obtained by receiving a video signal broadcasted in a given one of a plurality of channels by an antenna, and by demodulating the received video signal in synchronization with the modulation scheme used in the video signal. However, when noise is superposed on the video signal received by the antenna, the noise may be detected by the demodulator and the video signal, the noise included, may be superposed on the video signal, thereby causing the video signal to deteriorate. To prevent such a deterioration, there has been proposed a technique in which the video signal demodulated by the demodulator is fed back to the demodulator and compared with the video signal outputted from the demodulator, so that the demodulator is automatically controlled in accordance with the result of the comparison, thereby suppressing the noise superposed on the video signal. In such a known video signal receiving apparatus, the demodulated video signal is fed back to the demodulator and is compared with the video signal outputted from the demodulator, and, if a difference is found between the two signals, the difference is added to the video signal, so that the video signal is always controlled to be close to the video signal actually demodulated and outputted from the demodulator. This makes it possible to prevent the deterioration of the video signal due to the noise superposed on the video signal. However, in the known video signal receiving apparatus, the output of the demodulated video signal is fed back to the demodulator, and the result of the comparison between the two signals is added to the video signal, so that the video signal is controlled only at the time when the noise is superposed on the video signal. This requires that the video signal should be dem 2d92ce491b
