It's not clear from the site how to remove it, but I guess that the right way to do this is to delete the image with the same name. An automated docking and molecular dynamics study of chlorogenic acid and 5-caffeoyl quinic acid binding to beta-amyloid peptide: impact of the cofactor metal ions. The beta-amyloid peptide is associated with Alzheimer's disease (AD). Its over-production is triggered by metal ions in association with transition metal ions. These metal ions can act as cofactors in catalytic processes involved in amyloid aggregation. In the present work, an automated docking and molecular dynamics (MD) study of the interactions of chlorogenic acid and 5-caffeoyl quinic acid with beta-amyloid peptide (A?) in the presence of copper, zinc, and iron ions is carried out. The global minimum of interaction energies in the complexes obtained by the automated docking (HIPHOP) and the detailed analysis of the MD simulations indicates that the position of the ligand atoms in the binding site is more favored in the presence of metal ions than in the absence of them. In particular, the presence of Cu(2+) ions increases the favorable interactions of the

compounds with the peptide. These results were discussed in the light of the catalytic mechanism, which has been proposed for the beta-secretase-like enzyme BACE1, through which the A β peptide is produced. Our results suggest that the ligands investigated in the present work
