softwareResponse to Helicobacter
pylori eradication and influence of
H. pylori status on gastric atrophy
and mucosal cell proliferation in a
cohort of elderly Japanese
subjects. Our aims were to
examine the response to

Helicobacter pylori eradication and to elucidate the association between H. pylori infection and atrophy and cell proliferation in the gastric mucosa of elderly Japanese subjects. A total of 1,000 consecutive elderly subjects (65-84 years) were enrolled. H. pylori infection and gastric histology were examined at baseline and after 1 year of triple

therapy. The presence of *H. pylori* was assessed by serum IgG titer and histology. *H. pylori* was eradicated in 690 subjects (69.0%); 216 of these subjects (32.0%) were positive for atrophy and a further 73 (10.9%) were atrophic. Of the subjects who were *H. pylori* negative, 104 were positive for atrophy and 45 were atrophic. After 1 year, *H. pylori*-

negative subjects with atrophy showed a significantly decreased percentage of Ki-67-positive cells (65.0 vs. 61.3%, $P = 0.049$).

Among *H. pylori*-negative subjects, atrophic mucosa, including both atrophy and intestinal metaplasia, was associated with more severe cell proliferation (63.2 vs. 60.9%, $P = 0.024$), whereas atrophy alone was

not. *H. pylori* eradication
improved the mucosal 2d92ce491b
