Assessment of pain and quality of life in patients with breast cancer in India using a new Arabic-translated version of the Arabic-translated European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire. The aim of this study was to assess the feasibility of a translated and validated version of the European Organization for Research and Treatment of Cancer (EORTC) Quality of Life Questionnaire (QLQ-C30 and QLQ-BR23) in an Indian setting. The Arabic-translated (Alg-EORTC) QLQ-C30 and QLQ-BR23 were translated from English to Arabic, using the rigorous EORTC QLQ-C30 and QLQ-BR23 protocols. The translated versions were back-translated and the English versions were compared. A two-part questionnaire was prepared and administered to 100 patients with breast cancer in India. The questionnaire was assessed for its comprehensibility, clarity and understanding of the questions. Test-retest reliability was calculated for the QLQ-C30 using the intraclass correlation coefficient (ICC). The internal consistency of the Arabic-translated EORTC QLQ-C30 and QLQ-BR23 was calculated. The ICC for test-retest reliability of the QLQ-C30 was 0.85 and for the QLQ-BR23 was 0.81. Internal consistency was high for both questionnaires; the Cronbach's alpha value was 0.94 for the QLQ-C30 and 0.91 for the QLQ-BR23. Overall, patients reported significantly higher levels of pain and of symptoms related to the breast, arm and shoulder, as compared with the reference value. Only a few symptoms related to the breast were found to be significantly lower. The EORTC QLQ-C30 and QLQ-BR23 are valid and reliable measures of pain and quality of life in patients with
