Before starting Photo editing programs can be a bit daunting for beginners, especially when they are working in a program that is not their native tongue. In order to get the most out of Photoshop, you must have a good understanding of how the program works. Here are some things to know prior to beginning in Photoshop: Before you can open Photoshop, you must first download it from Adobe (download it here). Once it's installed, you'll need to log in with your Adobe account information. Now that you have Photoshop installed, you can open it by clicking the start button and typing in Photoshop CS5 (after CS5). Once Photoshop is open you'll see the Photoshop splash screen. Click on the "Log in" button if you have not yet logged in. After you log in, you can click the File menu and select "New." The new photo editing program will open. You can then open a JPG, PNG, GIF, TIFF, or other image file format. After opening the file, you'll see the Photoshop splash screen again. Step 1: Opening an image Step 2: The background layer Photo editing programs usually give you a few options in how you want to organize your layers and such. For our purposes, we're going to start with a new photo, because it is the simplest to work with. When you open an image in Photoshop, it will default to having a single layer, but you can add other layers if you desire. The top most layer can be adjusted for how visible you want an image to be. When your image is open, you can highlight the top most layer (usually the background) and drag it down below the other layers. This will create a second layer just underneath the original, thus creating a new layer. Some computer systems have multiple layers that can be moved around. A layer can be moved by either highlighting the layer, then clicking and dragging, or by dragging your cursor over the layer. Step 3: The active layer When you have a new layer, this will become your active layer. If you want to move that active layer, you'll have to click the active layer to highlight it. The active layer is a type of layer that shows the change you are making to the image. If you are making a color change to the background layer, such as change its color from black to purple, it will appear as if the active

Risk factors of prostate cancer mortality in the Framingham Heart Study. We estimated the joint and separate effects of age, sex, body mass index, race, smoking, alcohol, diabetes, blood pressure, a family history of prostate cancer, and percentage of free androgen index on the risk of death due to prostate cancer. The study population consisted of 1012 men, excluding those with history of prostate cancer at baseline. The men were followed from 1959 to 1970 through April 12, 1995. Men with history of prostate cancer were censored at the time of diagnosis. Cox regression models were used. Mortality from prostate cancer was significantly increased for current smokers and binge drinkers. Relative risk (RR) (95% confidence interval [95% CI]) of prostate cancer death for current smokers and binge drinkers compared with lifelong nonsmokers was 1.34 (1.07-1.71) and 1.65 (1.11-2.44), respectively. The risk of prostate cancer death was also significantly associated with percentage of free androgen index, race, body mass index, hypertension, and diabetes. RR of prostate cancer death was significantly elevated for the highest percentage of free androgen index (median = 21.0) compared with the lowest (median = 6.2) (RR = 2.37, 95% CI = 1.16-4.77), and there was a significant linear trend (p for linear trend = 0.005). All RRs of prostate cancer death for race, body mass index, hypertension, diabetes, and percentage of free androgen index were higher for African-Americans than Caucasians. These results show that current and binge drinkers may have a higher risk of prostate cancer death. United States Court of Appeals Fifth Circuit
