Tip Figure 2-2 shows the workspace. You can view a different workspace by choosing View→Workspaces. Figure 2-2. Although this window looks somewhat different from the standard workspace, this one can be useful to a Photoshop newbie. You may have to move buttons around to find the perfect configuration. Figure 2-3. The gray menu bar at the top of the workspace is a button bar, from which you can access the Photoshop tools. Hover your cursor over an item on the menu bar to display a tooltip with that tool's name. From the menu bar, you can access Tools, Edit, Image, Window, and All panels. You can also use the Back and Forward buttons to navigate through menus and submenus. ## Fun with Levels One of the most useful tools in Photoshop is the Levels tool, which you can find on the Photo menu at the top of the workspace. With the Levels tool, you can change the brightness of any image with a bit of mathematics. You can make a

Here is an example of where the left-brain analytical approach to religion came up “stupid”. The majority of the items on this list are taken from a humorous critique of CS Lewis’ *The Great Divorce*, posted in response to the Wall Street Journal article “Are Christians and other fundamentalists melting down?” by Daniel Henninger (WSJ, 12 October 2008). There are a few issues I would like to touch on: why is it described as “George” rather than “Martin”? because the answer is counter-intuitive. Although it is grammatically correct, and is probably what Lewis intended, it is more natural to me to refer to George as “George” rather than “Martin” and I had to really think long and hard to figure out how to refer to George as “Martin.” Gale-force winds suck. (How can it be described as “suck?”) Very comforting! (Wait, Lewis was an atheist?) Absolutely! I don’t know who edited this book, but it was clearly the editor of the book, because most of these items have been included. (Huh. OK. Got it. Continue.) The most egregious example, in my opinion, is “the Force”. (Could not resist. Watch Luke Skywalker defrost in the pod.) Also, it says “Darth Vader is Luke’s father” rather than “Vader is Luke’s father”. (Since when is “Darth” a name? His last name was “Vader”. You could also say George himself. And I think it is correct.) George (in all his peace loving glory) was definitely an advocate of truth in all it’s forms. I am with him on this one. (Has anyone else caught on to the fact that the list is really an ad hominem attack against the author of *The Screwtape Letters*, C.S. Lewis?) Someone was reading *Screwtape*, and let their mind run free. (But why would Lewis be on this list?) Oh my. (What the h**l? Jesus! What about the rest of the stuff?) I agree with Ligon on

I'm new to Haskell and I want to write a function to sort an array of data types by their "natural order" (by their constructor method names, which I think will be called toString or show). The array will also contain some types that have no explicit constructor - such as IntType, from Data.Typeable. So basically, given the types: data DataType = IntType | StringType data D = D IntType | D StringType | D [DataType] data M = M [D] I'd like to write something like this: sortArrayByNaturalOrder :: Ord a => [a] -> [a] sortArrayByNaturalOrder (x:xs) = map toSort x : sortArrayByNaturalOrder xs toSort :: DataType -> DataType toSort (D t) = D (toSort t) So that the output is: [D StringType, D IntType, D [D StringType, D IntType, D StringType, D IntType]] I want to do this for any data type, without any prior knowledge of its constructor - as far as I can tell, all it could be is DataType. Can I do this? Is this even possible? I thought the only way I could get it to work would be to have a separate function, given just a single data type, such as toSort IntType, but I haven't managed to get that to work. To be clear,
